

Reception area where speech could be heard prior to installing sound masking

One of the offices where confidential information is disclosed

360 Medico Legal required a two-stage design and construct project to resolve critical acoustic challenges. The initial engagement targeted noise transfer between offices via air conditioning grills. Following its success, the system was expanded across the entire level to enhance speech privacy and reduce distractions.

The comprehensive solution spanned open-plan workstations, client waiting areas, clinical offices, and boardrooms. Soundmask installed SM-TC-1265 cut-in transducers powered by a four-channel Soundmask GQ, creating distinct zones with tailored acoustic levels.

Delivered with minimal disruption, the system was professionally commissioned and calibrated. Enhanced tuning was applied to high-confidentiality zones, while shared areas were balanced for optimal comfort. The expanded system created a secure, focused, and professional environment essential for medico-legal practice.
