

One of the meeting rooms which required speech privacy

Three zones per floor ensured that each area had optimum masking levels

The Department of Justice required a full-building acoustic solution across ten levels of their facility. In a high-sensitivity government environment, minimizing workplace distractions and securing speech privacy were paramount to maintaining operational integrity.

Soundmask designed and delivered a comprehensive Soundmask system. Each level incorporated three zones, using a rack-mounted Soundmask GQ and SM-T-1200 transducers. The system was meticulously tailored across executive suites, open-plan workspaces, meeting rooms, and quiet zones.

Following professional commissioning and targeted calibration, the installation successfully established speech confidentiality, while complementing the Department's biophilic design. The Department now benefits from seamless acoustic coverage that protects sensitive information, reduces daily distractions, and enhances productivity across the entire facility.
